PORTFOLIO

portfolio-yaroslav-stopenchuk

Skills

LANGUAGES

TypeScript, JavaScript, HTML5, CSS / SCSS

FRAMEWORKS

React, Next.js, Node.js

STATE & DATA

Redux Toolkit, React Query, Zustand

UI

Tailwind CSS, Radix UI, shadcn/ui

BACKEND

Supabase, PostgreSQL, Stripe, REST / OpenAPI, GraphQL

TESTING

Vitest, Playwright, Testing Library

DEVOPS

Git, Docker, Kubernetes, CI/CD, Vercel

AI DEV

Claude Code, agent-first workflow, Cursor

Languages

Polish (B2)

English (B2)

Ukrainian (Native)

Strengths

Mentoring & Code Review

Agile / Scrum

Cross-functional Collaboration

Availability

Open to B2B or employment contract, at two weeks' notice. Remote (Poland / EU) or hybrid in Wrocław.

Yaroslav Stopenchuk

Frontend / Full-Stack Developer

React · Next.js · TypeScript

Building React, Next.js and TypeScript products end to end, with 3 years of commercial experience. Currently shipping an AI assistant web client in a Scrum team that develops agent-first with Claude Code, delivering routine work ~2x faster while owning architecture and review. Built a multi-tenant SaaS with row-level tenant isolation, 4-tier RBAC and Stripe billing, and an offline-first point-of-sale that keeps selling through internet outages. ~80% test coverage with Vitest and Playwright.

Experience

Full-Stack Developer

Mar 2026 - Present

PLZ Spółdzielnia, Warsaw (Remote)

- Built an AI assistant web client in React 19 + TypeScript, shipping its first release to a closed user community in September 2026: real-time SSE streaming, Zustand state, document generation (DOCX/PDF), file uploads and voice I/O, in an accessible i18n (PL/EN) interface.
- Keep the app at ~80% test coverage (Vitest + Playwright) and ship it through multi-stage Docker and Kubernetes on GitHub Actions CI/CD.
- Work in a Scrum team: daily stand-ups, sprint planning, pair programming, and code review on every pull request, against a shared OpenAPI contract with the backend team.
- Deliver through the team's mandated agent-first workflow: turn tickets into specs, direct Claude Code to implement, and own architecture, review and testing — shipping routine features ~2x faster than hand-coding.

Freelance Full-Stack Developer

May 2025 - Present

Self-employed, Wrocław

- Designing and building Lightweight POS with one other developer, an offline-first point-of-sale and inventory system for a family-run retail shop, now in pre-launch testing: client-generated operation IDs queued in IndexedDB and deduplicated server-side, so the till keeps selling through internet outages and reconciles cleanly on reconnect.
- Built and shipped Smart Shift Scheduler, a multi-tenant workforce SaaS (Next.js, TypeScript, Supabase/PostgreSQL + row-level security) with 4-tier RBAC and org-level data isolation; in regular use planning shifts for a team of around ten.
- Implemented drag-and-drop scheduling (@dnd-kit) and a shift-generation algorithm that cut manual scheduling time ~75%, plus a Recharts analytics dashboard, i18n, dark mode, and PWA (Lighthouse 100 / 100 / 96).
- Integrated Stripe subscription checkout (webhook-driven upgrades), token-based invitations, and transactional emails.

Frontend Developer

Oct 2023 - May 2025

RED Software House, Wrocław

- Built Geosoft from scratch: a bilingual Next.js storefront on a headless WordPress backend consuming content over GraphQL — product catalogue, publications library and search for an industrial manufacturer. [Live ↗](#)
- Built Elektrobohater, a social platform serving thousands of users, with Redux Toolkit & React Query: real-time feeds, filtering, and content management.
- Delivered 10+ commercial projects (Next.js, Gatsby) for clients including Opera and the Museum of Warsaw, cutting initial load times ~12% via GSAP and asset optimization, in a shared codebase alongside designers, backend and QA.
- Mentored a junior developer with hands-on code reviews, cutting their ramp-up time ~40%; refactored a legacy class-component codebase to hooks on the Museum of Warsaw platform.

Projects

Smart Shift Scheduler (Next.js, TypeScript, Supabase) [Demo ↗](#)

GitHub Search Autocomplete (React 19, TypeScript, Vitest)

Accessible combobox over the GitHub API: debouncing, AbortController race handling, rate-limit reporting. 51 tests, no runtime dependencies beyond React. [Demo ↗](#)

Warsaw Museum Collections (React, Docker)

Refactored a legacy class-component codebase to hooks and built shopping-cart logic. [Live ↗](#)

Education

Bachelor of Computer Science

2019 - 2023

Lviv Polytechnic National University
